## CHAPTER

# 1

# Introduction to Software Engineering

## UNIT I

### Syllabus :

The Nature of Software, Software Engineering.

### 1.1 Introduction

- Computers are becoming an unavoidable necessity or say the part and parcel of our life. We do most of our day's work using computers and digital devices – to book railway tickets or movie tickets, search for some books on amazon, bank transactions, and any task you name it is done using computers. Therefore it is very important to build these computerized systems in an effective way.
- Building such systems requires certain technical as well as communication skills and capabilities to understand and follow a planned and systematic procedure.

### 1.2 Software

#### Q. Define software.

- Software is a set of instructions to acquire inputs and to process them to produce the desired output in terms of functions and performance as determined by the user of the software. It is developed to handle an *Input-Process-Output* system to achieve predetermined goals.

Fig. 1.2.1 : Basic diagram of a software

- Software encompasses of
  - Instructions (Computer programs)
  - Documents (Describes programs)
  - Architecture including Data Structures (Enables programs)
- Software includes things such as websites, programs or video games that are coded by programming languages like C or C++.

#### ☞ Software - a Product and a Vehicle :

"Software plays a dual role - both as a *product* and a *vehicle* that delivers a product".

#### ☞ Software is a product :

- Delivers computing potential
